

Falls are the major cause of injuries to the elderly, and a large percentage of these falls occur with patients who suffer from Nocturia and/or Insomnia

oowwl is the answer to this problem and will help you in your battle to eliminate injuries due to falls.

As you are well aware Nocturia and/or Insomnia can force a patient to get out of bed at night sometimes numerous times. Each time the patient gets up there is a risk for fall.

With the **oowwl** as soon as the patients gets up from bed it will activate three import factors to help the person orient themselves.

1. > A light will turn on to immediately give them a sense of visual orientation.
2. > A recording will be activated in a familiar voice to give them audio simulation to further> increase their lucidity and orientation which is impaired by awakening from typically a> drug induced sleep.
3. > A signal will be sent to a central monitored computer to alert the staff that an> individual is out of bed or to the phone number of a family member.

As simple as this sounds it can be a major difference between a safe trip to the bathroom and back to bed or a fall resulting in a possible serious injury.
